## **About RSIS**

The S. Rajaratnam School of International Studies (RSIS) was established in January 2007 as an autonomous School within the Nanyang Technological University. Known earlier as the Institute of Defence and Strategic Studies when it was established in July 1996, RSIS' mission is to be a leading research and graduate teaching institution in strategic and international affairs in the Asia Pacific. To accomplish this mission, it will:

- Provide a rigorous professional graduate education with a strong practical emphasis,
- Conduct policy-relevant research in defence, national security, international relations, strategic studies and diplomacy,
- Foster a global network of like-minded professional schools.

### **GRADUATE EDUCATION IN INTERNATIONAL AFFAIRS**

RSIS offers a challenging graduate education in international affairs, taught by an international faculty of leading thinkers and practitioners. The Master of Science (M.Sc.) degree programmes in Strategic Studies, International Relations and International Political Economy are distinguished by their focus on the Asia Pacific, the professional practice of international affairs, and the cultivation of academic depth. Thus far, students from more than 50 countries have successfully completed one of these programmes. In 2010, a Double Masters Programme with Warwick University was also launched, with students required to spend the first year at Warwick and the second year at RSIS.

A small but select Ph.D. programme caters to advanced students who are supervised by faculty members with matching interests.

### **RESEARCH**

Research takes place within RSIS' six components: the Institute of Defence and Strategic Studies (IDSS, 1996), the International Centre for Political Violence and Terrorism Research (ICPVTR, 2004), the Centre of Excellence for National Security (CENS, 2006), the Centre for Non-Traditional Security Studies (Centre for NTS Studies, 2008); the Temasek Foundation Centre for Trade & Negotiations (TFCTN, 2008); and the recently established Centre for Multilateralism Studies (CMS, 2011). The focus of research is on issues relating to the security and stability of the Asia Pacific region and their implications for Singapore and other countries in the region.

The school has four professorships that bring distinguished scholars and practitioners to teach and to conduct research at the school. They are the S. Rajaratnam Professorship in Strategic Studies, the Ngee Ann Kongsi Professorship in International Relations, the NTUC Professorship in International Economic Relations and the Bakrie Professorship in Southeast Asia Policy.

### **INTERNATIONAL COLLABORATION**

Collaboration with other professional schools of international affairs to form a global network of excellence is a RSIS priority. RSIS maintains links with other like-minded schools so as to enrich its research and teaching activities as well as adopt the best practices of successful schools.

## Abstract

The paper looks at how governments can be better prepared to deal with increasing complexity. Complexity produces strategic shocks and generates wicked problems. But complexity is different from merely complicated. A more complex operating environment increasingly challenges the paradigm of governments. A whole-of-government approach is a vital response to managing an increasingly complex world. There are also various tools that can be deployed to help governments better deal with complexity, and reduce the frequency and amplitude of strategic shocks.

\*\*\*\*\*

**Mr Peter Ho** is Senior Advisor to the Centre for Strategic Futures and Senior Fellow in the Civil Service College, and also serves as an Adjunct Professor with the S. Rajaratnam School of International Studies. He is a Senior Fellow of the Lee Kuan Yew School of Public Policy, and was formerly the Head of the Civil Service in Singapore. This is an adaptation of his speech that was delivered at the Australia-New Zealand School of Government (ANZSOG) Annual Conference 2012 in Wellington, New Zealand on 26 July 2012.

# Governing for the Future: What Governments can do

## Introduction

On 25 February 2003, the SARS virus entered Singapore through three women who had returned from Hong Kong with symptoms of atypical pneumonia.<sup>1</sup> The virus then spread with frightening speed through the hospital system. It confounded our medical authorities in the beginning. They did not know how the virus spread and why it spread so aggressively. The fatality rate was shocking. By the time the SARS crisis was declared over in Singapore, 33 people had died out of the 238 who had been infected.<sup>2</sup>

## Black Swans

SARS was a black swan for Singapore. Nicholas Nassim Taleb described a black swan as a hard-to-predict event with a large impact.<sup>3</sup> Indeed, it was a frightening time for Singapore. Overnight, visitor arrivals plunged, and the entire tourism industry came to a grinding halt. SARS severely disrupted the Singapore economy, leading to a contraction and a quarter-long recession that year.

There are many lessons to be learnt from the SARS crisis of 2003. But I would like to highlight one, in order to set the context for this paper. It is that other black swans will surprise us, time and again, as much, if not more, than we were by SARS.

In recent years, the world seems to have been beset by a succession of strategic shocks including 911, the financial and economic turbulence of 2008/2009, the 2011 Japanese tsunami and nuclear meltdowns, the Christchurch earthquake of February 2011 in New Zealand<sup>4</sup> and the Eurozone crisis.

Furthermore, the frequency of such shocks seems to be increasing, and the amplitude of their impact appears to be growing.

The question is why?

## The Great Acceleration

From the middle of the 20<sup>th</sup> century – a period that is sometimes called the “Great Acceleration” – change has accelerated at a pace and on a global scale that is unprecedented in history. Population growth has surged. Combined with rapid urbanisation, it has generated enormous consumer demand. The effort to meet this demand through industrialisation and mass production has had a huge but unpredictable impact on the earth’s eco-system. Globalisation resulting from and combined with technological innovation has, in turn, accelerated change on all fronts – political, economic and social.

## Complexity

Much of this change has followed unpredictable trajectories. The reason for this is “complexity”.<sup>5</sup>

Complex is not the same as complicated. It is something very different. The natural world is complex. An engineering system is merely complicated. It could be a machine or an aeroplane or a telecommunications satellite. Its inner workings may be hard for a layman to understand. But it is designed to perform certain pre-determined functions that are repeatable. It embodies the Newtonian characteristics of predictable cause and effect.

In contrast, a complex system will not necessarily behave in a repeatable and pre-determined manner. Cities are complex systems, as are human societies. The earth’s ecology is also a complex system. Political systems are complex. Countries are complex. The world as a whole is complex and unordered. In all likelihood, a complicated world has not existed for a very long time – if it ever did.

The “Great Acceleration” has seen huge leaps forward in technology – in telecommunications, the internet, and transportation – leading to vastly increased trade and the movement of people around the world. But the connections and feedback loops resulting from the “Great Acceleration” have greatly increased complexity at the global level.

The ancient Chinese philosopher, Lao Tzu, instinctively grasped the complex nature of the world that we live in when he wrote in the “Tao Te Ching” (or the Way) that “everything is connected, and everything relates to each other”.<sup>6</sup> But connections and interactions within a complex system are extremely difficult to detect, inexplicable, and emergent. Efforts to model complex systems, such as the Club of Rome’s famous model of economic and population growth, have not proven very useful.<sup>7</sup> Unlike in a complicated system, the components of a complex system interact in ways that defy a deterministic, linear analysis.

---

<sup>5</sup> For a good discussion of complexity science, please see Melanie Mitchell, *Complexity: A Guided Tour*, (Oxford [UK]; New York: Oxford University Press, 2009); Neil Johnson, *Two’s Company, Three is Complexity – A Simple Guide to the Science of all Sciences*, (New York and London: One World Publications, 2007); Thomas Homer-Dixon, *Ingenuity Gap – Facing the Economic, Environmental, and Other Challenges of an Increasingly Complex and Unpredictable Future*, (New York: Vintage Books, 2002).

<sup>7</sup> Donatella H. Meadows, Dennis L. Meadows, Jorden Randers and William W. Behrens, *The Limits of Growth. A Report for the Club of Rome’s Project on the Predicament of Mankind*, (New York: Universe Books, 1972).

As a result we are constantly surprised and shocked by black swans and other unknown unknowns.

### **Wicked Problems**

Unfortunately, complexity not only generates black swans, but also gives rise to what the political scientist Horst Rittel called “wicked problems”.<sup>8</sup> Wicked problems have no immediate or obvious solutions. They are large and intractable issues. They have causes and influencing factors that are not easily determined *ex ante*. They are highly complex problems because they contain many agents interacting with each other in often mystifying ways. They have many stakeholders who not only have different perspectives on the wicked problem, but who also do not necessarily share the same goals.

Tackling one part of a wicked problem is more likely than not going to lead to new issues in other parts. Satisfying one stakeholder could well make the rest unhappy. A key challenge for governments is to move the many stakeholders towards a broad alignment of perspectives and goals. But this requires patience and a lot of skill at stakeholder engagement and consensus building.

Climate change is an example of a wicked problem at a global level. Pandemics are another. So are aging populations in the developed world. Sustainable economic development, which is not unconnected to the triangular problem of food, water and energy security, is an enormous wicked problem.

In our increasingly inter-connected and globalised world, such wicked problems do not manifest in a singular fashion. Their impact can and will be felt around the world, in many forms, and in many fields like politics, economics, and in social and many other dimensions.

### **Retrospective Coherence**

In complexity theory, there is a concept known as “retrospective coherence”.<sup>9</sup> The current state of affairs always makes sense when we look backwards. The current pattern is logical. But this is more than saying that there is wisdom in hindsight. It is only one of many patterns that could have formed, any one of which would have been equally logical. Simply because we can provide an explanation for why the current state of affairs has arisen does not mean that we are operating in a complicated and knowable world.

While what we are today is the result of many decisions taken along the way, retrospective coherence says that in a complex system, even if we were to start again and make the same decisions, there is no certainty that we would end up in the same situation. This is another way of saying that applying the lessons of history is not enough to guide us down the right path into the future.

---

<sup>9</sup>Dave Snowden, “Complex Acts of Knowing: Paradox and Descriptive Self-Awareness,” *IBM Global Service*, (July 2002).

Available:[http://www.imamu.edu.sa/Scientific\\_selections/Documents/IT/complexity\\_of\\_knowing.pdf](http://www.imamu.edu.sa/Scientific_selections/Documents/IT/complexity_of_knowing.pdf) (accessed 15 August 2012).

Governments that do not understand retrospective coherence will often assume that the operating environment is merely complicated – and not complex – one in which cause and effect are linked such that the output can be determined from the input, in which one step leads predictably to the next. This is of course a dangerous assumption if the operating environment is complex.

### **Governments and Complexity**

When governments ignore the complexity of their operating environment, they are at risk of assuming that policies that succeeded in the past will continue to work well in the future. They will deal with wicked problems as if they are amenable to simple and deterministic policy prescriptions.

The temptation to take this approach is understandable. It is easier, requires less resource, and may actually lead to positive outcomes – but only in the short term.

However, government policies that do not take complexity into account can, and often do, lead to unintended consequences, with a real danger of national failure in the long run.

Unfortunately, the evidence suggests that many governments will opt to take this path, either out of political expediency, or because of cognitive failures, or simply because they lack an understanding and the tools to deal with complexity.

Those governments that learn to manage complexity, and how to govern in a complex operating environment, will gain a competitive advantage over those that do not.

But to manage complexity requires fundamental changes to the mind-set, capabilities and organisation of government.

Professor Yaneer Bar Yam, a complex systems scientist, writes that “the most basic issue for organisational success is correctly matching the system’s complexity to its environment”.<sup>10</sup>

This is another way of saying that the complexity of the government developing the policy should match the complexity of the system that will be affected by the policy.

### **Fighting a Network with a Network**

Let me illustrate this with an example. On 7 December 2001, the authorities announced the detention of several Singaporeans who were members of a previously unknown network of extremists, the pan-Southeast Asian *Jemaah Islamiyah* (or JI). The JI had been plotting acts of mass terror against several targets in Singapore. Singaporeans were preparing to kill fellow Singaporeans in pursuit of demented ideological goals.

---

<sup>10</sup>Yaneer Bar Yam, *Making Things Work: Solving Complex Problems in a Complex World*, (Boston, Mass.: Knowledge Press, 2004), p. 91.

This was a black swan for Singapore that literally overnight produced a wicked problem for the Government – how to deal with the threat posed by extremists who were part of a larger Southeast Asian network, and who lived and worked within the community, like ordinary Singaporeans.

Someone told me in those uncertain days that you needed a network to fight a network. It was a profound observation that implicitly acknowledged that the JI, as a sprawling, multi-layered network, was a complex organisation.

Our response, both in terms of organisation as well as policy, had to match the JI's complexity. It was not possible to destroy the JI network by just hunting down the leadership and decapitating it. To do so would be to deny the JI's essentially complex nature.

Singapore took a whole-of-government – perhaps even a whole-of-nation – approach to the threat posed by the JI. The traditional approach, of delineating the boundaries between agencies, so that each would be responsible for a particular area, clearly would not work. No government agency had the full range of competencies or capabilities to deal completely with this complex threat.

Rather than go the American way by creating our own Department of Homeland Security, we decided that a better way would be to strengthen coordination and integration among the government agencies. We leveraged on the diverse strengths of existing agencies. This meant coordinating the counter-terrorism efforts of the line agencies and ministries at the operational level, while integrating strategy and policy at the whole-of-government level. This approach meant that we would only have a small but active centre – the National Security Coordination Secretariat – with the capacity to drive the strategic national agenda in counter-terrorism, but which would not interfere with the accountabilities of each agency.

So, many agencies were roped in, and at different levels, from the security, economic and social sectors. Community groups and leaders were activated to manage potential frictions and manage communal sensitivities.

In the beginning, it was a real challenge. The non-security agencies felt that this was a matter to be dealt with by the security agencies. The security agencies in turn felt that their turf was being trampled on.

### **Whole-of-Government**

But now looking back, this whole-of-government approach had a compelling logic. A complex and multi-layered network of government agencies and non-governmental organisations had been created. The policies that were implemented were complex – both defensive and offensive, employing both hard and soft power. We established a complex system to deal with a complex situation. It is an approach that the Singapore Government has since applied to other wicked problems like population and climate change.

Governments will need to consider how they should be organised to deal with black swans, unknown unknowns, and the wicked problems that complexity generates. Creating new

departments to deal with new wicked problems can be wasteful and ultimately ineffective if these creations do not contain enough organisational complexity.

Developing policies and plans to deal with such wicked problems requires the integration of diverse insights, experience and expertise. People from different organisations, both from *within* and *outside* government, have to come together and pool their knowledge in order to discover potential solutions. Cooperative mechanisms need to be set up to enable the sharing of information and to strengthen collective action.

The whole-of-government approach injects diversity and complexity into the policy process. It recognises that in complex situations, and when dealing with wicked problems, insight and good ideas are not the monopoly of single agencies or of government acting alone. It strikes a balance between strength and stability of the formal vertical government structure, and the diversity from different perspectives and solutions derived from a larger and more varied horizontal network of government and national resource.

While the whole-of-government approach may be an imperative, it is not easily achieved. Governments, like any large hierarchical organisation tend to optimise at the departmental level rather than at the whole-of-government level.

In a hierarchy, the leader at the top receives all the information and makes the decisions. But, under stress, hierarchies can be unresponsive – even dangerously dysfunctional – because there are in reality decision-making bottlenecks at the top.

Complexity stresses hierarchies. The world that governments operate in today is too complex and too fast changing for the people at the top to have the full expertise and all the answers to call all the shots.

Therefore, vertical silos need to be broken down, so that information can flow horizontally to reach other departments. It is not “need to know” but knowing enough so that each component of the larger organisation can respond to issues and challenges as they arise. An environment that encourages the spontaneous horizontal flow of information will enlarge and enrich the worldview of all departments. This in turn improves the chances that connections hidden by complexity, as well as emergent challenges and opportunities, are discovered early.

### ***Auftragstaktik***

The German military adopted with great success (at least at the operational level) a concept of military command called *auftragstaktik*.<sup>11</sup> It was a philosophy of command that acknowledged the complexity and the chaos of war.

In *auftragstaktik*, even the most junior officers were empowered to make decisions on the spot, because they had a better and more direct feel for the situation on the ground. It meant that down the line, every officer had to understand not just the orders, but also the intent of

---

<sup>11</sup>*Auftragstaktik* is defined as mission-type or task-oriented tactics. *Auftragstaktik* essentially encourages greater initiative by leaders at all levels of command.

the mission. In turn he was empowered to make decisions to adjust to the situation as he judged it, in order to better fulfil the intent of the mission.

Whole-of-government implicitly contains the central idea of *auftragstaktik*, which is that in complexity, it is not possible for everything to be centrally directed. Not unlike *auftragstaktik*, whole-of-government depends critically on people at all levels understanding how their roles fit in with the larger national aims and objectives. Agencies must have a strong sense and a shared understanding of the challenges that the nation faces, and the underlying principles to guide responses. Then it depends on the good sense of each agency to ensure that its own plans and policies are aligned with the national imperatives, to the point that they instinctively react to threats and opportunities as they arise, knowing that what they do will advance the larger national, rather than departmental interests.

Whole-of-government is a holy grail. In countries like Singapore, it remains very much work in progress. It requires emphasis, support and constant attention from the top.

### **Dealing with Cognitive Biases**

There is another challenge to governments in complex situations. It was evident in the April 2010 eruption of the Icelandic volcano with the unpronounceable name.<sup>12</sup> When a huge cloud of volcanic dust started to spread over Europe, air traffic authorities grounded thousands of aircraft as a safety precaution. Europe was almost paralysed. It caused travel chaos around the world and disrupted global supply chains for weeks.

We know that volcanoes erupt from time to time. We also know that it is risky to fly through volcanic ash clouds. Yet why, despite this knowledge, was the world so surprised and unprepared for the impact of this eruption?

First, although the risk of eruption is known, it is very difficult to assess its probability of occurrence. Behavioural economists point out that we underrate the probability of an event when it has not happened recently and overrate the probability of an event when it has. As a result of this cognitive bias, the risk of an eruption was underrated in this case, as the Icelandic volcano had been quiescent for a long time.

Second, the effect of the eruption on aircraft flights was the result of complex interconnectivities and therefore highly unpredictable. When the Icelandic volcano erupted, aviation authorities depended on the predictions of analytical models and reacted with caution by shutting down all flights. But as the commercial impact grew, the industry began to question the reliability of these models and proposed doing experimental flights to probe whether it was safe to fly. In the event, the experimental flights proved to be a better indicator for action than reliance on the models. This is a clear demonstration of the value of exploration and experimentation when we are confronted with complex phenomenon instead of depending only on the predictions of analytical models.

Cognitive bias and the extreme difficulty of estimating the cumulative effects of complex events make preparing for unforeseen situations an exercise fraught with difficulty. It also adds to the challenges of governments operating in complex situations.

---

<sup>12</sup>Valur Gunnarsson, "Iceland Volcano: Hundreds Evacuated After Eruption," *The Guardian*, 15 April, 2011.

## Managing Complexity

In such a complex operating environment, governments should be adaptive, and able to navigate situations characterised by emergence, multi-causality and ambiguity, as they were during the eruption of the Icelandic volcano.

Governments often have to make big decisions, and develop plans and policies, under conditions of incomplete information and uncertain outcomes. It is not possible to prepare exhaustively for every contingency. Instead, a “search and discover” approach should be adopted. The deployment of experimental flights to check out the real risk of flying into a cloud of volcanic ash exemplifies this approach. The military calls this approach the OODA loop (Observe, Orientate, Decide, Act), which is a recurring cycle of decision-making that acknowledges and exploits the uncertainty and complexity of the battlefield.<sup>13</sup>

Scenario planning is a linear method of carrying out the OODA loop, in the sense that it projects futures based on our understanding of the operating environment today. Used intelligently, it can be a very important tool for planning, and can help overcome cognitive biases by challenging our mental models. But it is insufficient in a complex unordered environment.

In this regard, non-linear methods should be part of the government complexity toolbox. They include back-casting, policy-gaming (which is akin to military war-gaming, but applied to the civilian policy context to condition policy-makers to complex and uncertain situations, and to help them confront their cognitive biases), and horizon scanning (which is the process of detecting emerging trends, threats and opportunities).

Governments must also be able to manage the risk that is a natural result of operating in complexity. There will always be threats to national outcomes, policies and plans, because no amount of analysis and forward planning will eliminate the volatility and uncertainty that exists in a complex world. These threats constitute strategic risk.

But there is little by way of best practice to systematically address or ameliorate the threats to national goals that these risks pose. In Singapore, the government is developing a unique Whole-of-Government Integrated Risk Management (WOG-IRM) framework – a governance chain that begins with risk identification and assessment at the strategic level, to monitoring of risk indicators, and finally to resource mobilisation and behavioural changes to prepare for each anticipated risk.<sup>14</sup> WOG-IRM also plays an imperfect but important role in discovering the inter-connections among risk factors. This in turn helps to reduce some of the complexity. The WOG-IRM framework is work-in-progress, and we have started using it for strategic conversations on risks that occur at the whole-of-government level.

---

<sup>13</sup>See David Fadok, who wrote one of the earliest studies on Boyd and on the concept of the OODA loop. He also distilled many of the critical points of Boyd’s theories. David S. Fadok, ‘John Boyd and John Warden: Air Power’s Quest for Strategic Paralysis,’ in Col. Phillip S. Meilinger (ed.), *The School of Advanced Airpower Studies – The Paths to Heaven: The Evolution of Airpower Theory*, (Maxwell Air Force Base, Alabama: Air University Press, 1997), p. 366.

<sup>14</sup>Ben Nadarajan, *Close Watch – A Nation’s Resolve to Secure Singapore*, (Singapore: National Security Coordination Secretariat and Straits Times Press, 2012), p. 110.

## **Organising in Complexity**

The WOG-IRM framework is also critical to building resilience, which is the ability to cope with strategic shock by adapting to, or even transforming with, rapid and turbulent change. Resilience ought to be a key characteristic of governments that operate effectively in a complex environment.

Resilient governments must go beyond an emphasis on efficiency. Lean systems that focus exclusively on efficiency are unlikely to have sufficient resources to deal with unexpected shocks and volatility, while also having the bandwidth to make plans for an uncertain future filled with wicked problems.

This is not an argument for establishing bloated and sluggish bureaucracies, but one important idea is for resilient governments to have a small but dedicated group of people to think about the future. The skill-sets needed are different from those required to deal with short-term volatility and crisis. Both are important. But those charged with thinking about the future systematically should be allocated the bandwidth to focus on the long-term without getting bogged down in day-to-day routine. They will become repositories of patterns that can be used to facilitate decision-making, to prepare for unknown unknowns, and perhaps to conduct policy experiments through policy-gaming or other simulations.

To this end, the Singapore Government set up the Centre for Strategic Futures (CSF) a couple of years ago. It is think tank that promotes a whole-of-government approach to strategic planning and decision-making. It works on leading-edge concepts like WOG-IRM and resilience. It promotes fresh approaches for dealing with complexity like policy-gaming. It encourages experiments with new computer-based tools and sense-making methods to improve horizon scanning. Although a small outfit, the CSF is a catalyst for strategic change in the government and its agencies.

## **Conclusion**

The future promises ever more complexity, carrying in its train more black swans and unknown unknowns. Governments must learn how to operate and even thrive in this complexity, and to deal confidently with strategic shocks when they occur. The first step is to acknowledge the inherent complexity of the operating environment. Then they should consider the imperative of a whole-of-government approach, and the adoption of new non-linear tools for managing complexity, and strategic risk. These will not eliminate shocks. But by improving the ability to anticipate such shocks, governments might actually reduce their frequency and impact. In turn this will help make governments and nations more resilient as their leaders govern for the future.
