ANNEX 3 NGO STATEMENT ON THE CONVENTION ON BIOLOGICAL DIVERSITY

Introducing the Convention on Biological Diversity:

The Convention on Biological Diversity commonly referred to as the Biodiversity Treaty was negotiated under the auspices of the United Nations Environment Programme (UNEP) and adopted on 22 May 1992.

Having secured its 30th ratification in September 1993, the Biodiversity Treaty entered into force on December 29th, 1993. There are currently 188 parties to the Convention¹. The three goals of the CBD are to promote the conservation of biodiversity, the sustainable use of its components, and the fair and equitable sharing of benefits arising out of the utilization of genetic resources.

The CBD defines biodiversity as "the variability among living organisms from all sources including, inter alia, terrestrial, marine and other aquatic ecosystems and the ecological complexes of which they are part; this includes diversity within species, between species and of ecosystems²." Parties to the treaty have affirmed their sovereign right over the biological resources found within their countries, while accepting the responsibility for conserving biological diversity and using biological resources in a sustainable manner. However, one of the most controversial issues addressed by the Convention, concerns *intellectual property rights* related to biological and genetic resources: although much of the earth's biodiversity is found in developing countries, these countries have not necessarily benefited equally with developed countries from industrial, medical, agricultural, and other issues of biological and genetic resources. As such, the Treaty commits Parties to "fair and equitable sharing of the benefits arising out of the utilization of genetic resources³."

Other treaty articles examine Access to Genetic Resources, Access to and Transfer of Technology, and Handling of Biotechnology and Distribution of its benefits. One related topic also discusses the role that the indigenous population plays in maintaining biodiversity.

Another major issue addressed by the Convention is the level of financial commitment required of developed countries in support of developing countries. As a consequence of consecutive debating sessions, parties agreed that in Article 20 of the CBD "developed country Parties shall provide new and additional financial resources to enable developing country Parties to meet the agreed and full incremental costs to them of implementing measures which fulfill the obligations of this Convention and to benefit from its provisions and which costs are agreed between a developing country and the institutional structure referred to in article 21⁴..."

Article 21 mandates establishing a mechanism for distributing financial aid to developing countries, even though it does not suggest a mandatory funding level, which constitutes another subject of controversy.

A Brief Analysis of the 7th Conference of Parties (Kuala Lumpur, February 9-20):

More than 2000 experts in biodiversity and sustainable development along side world government bodies and non governmental organizations have participated in the 7th Conference of Parties (COP7) to the Convention on Biological Diversity in Kula Lumpur Malaysia from February 7 to 20⁵. Topics that were considered to be of high priority were discussed, such as mountain systems, the role of protected areas in protecting biological diversity and the transfer of technology and technological cooperation.

COP7 was certainly one of the busiest and most ambitious COPs ever; the COP agenda gave the Parties the opportunity to focus on two of the CBD's most significant challenges: "respond with concrete measures to the outcomes of the 2002 World Summit on Sustainable Development (WSSD), including the target of significantly reducing biodiversity loss by 2010, and show that the CBD is the most appropriate and efficient policy framework to address biodiversity⁶."

Hence, global biodiversity indicators started to be used for the evaluation progress in meeting the targets, and included: extension of natural habitats, abundance and distribution of species, change in the status of endangered species, genetic diversity of socioeconomically important species, and coverage of protected areas⁷.

In short, COP7 have laid the foundation for a better integration of the Convention on Biological Diversity onto the Sustainable Development Agenda.

Introducing the Cartagena Protocol on Biosafety:

Since the early 1970s, modern biotechnology has enabled scientists to genetically and biochemically modify plants, animals and microorganisms to create living modified organisms (LMOs). Many countries with biotechnology industries already have domestic legislation in place intended to ensure the safe transfer, handling, use and disposal of LMOs and their products. These precautionary practices are collectively known as "biosafety". However, there are no binding international agreements addressing situations where LMOs cross national borders.

Articles 19.3 of the CBD provides for Parties to consider the need for, modalities of, a protocol setting out procedures in the field of the safe transfer, handling and use of LMOs that may have an adverse effect on biodiversity and its components⁸.

The Biosafety Protocol, adopted on 29 January 2000, entered into force on 11 September 2003, 90 days after receipt of its 50th instrument of ratification. "The Biosafety Protocol addresses the safe transfer, handling and use of LMOs that may have an adverse effect on biodiversity, taking into account human health, with a specific focus on transboundary movements. It establishes an advance informed agreement (AIA) procedure for imports of LMOs for intentional introduction into the environment, and also incorporates the precautionary principle and mechanisms for risk assessment and risk management. The Protocol establishes a Biosafety Clearing-House (BCH) to facilitate

⁸ A Brief Introduction to the UN Conventional on Biological Diversity at <u>www.iisd.ca/biodiv</u>

information exchange, and contains provisions on capacity building and financial resources with special attention to developing countries and those without domestic regulatory systems⁹." There are currently 87 Parties¹⁰ to the Protocol.

A Brief Analysis of the First Meeting of the Conference of the Parties to the Convention on Biological Diversity serving as the meeting of the Parties to the Cartagena Protocol on Biosafety: 23-27 February 2004, kuala Lumpur Malaysia:

The First Meeting of the Conference of Parties (COP) to the Convention on Biological Diversity (CBD) serving as the Meeting of the Parties to the Cartagena Protocol on Biosafety (COP/MOP-1) took place from 23-27 February 2004, at the Putra World Trade Centre in Kuala Lumpur, Malaysia. Over 750 participants attended the meeting, representing 81 Parties to the Protocol, 79 non-Parties, as well as UN agencies, non-governmental organization (NGOs), intergovernmental organizations, indigenous and local communities, academia and industry.

COP/MOP-1 faced the important task of setting up the operational framework that would enable the Protocol's effective implementation. Delegates had their hands full with issues such as developing a compliance procedure with the Protocol, elaborating documentation requirements under Article 18 (Handling, transport, packaging and identification (HTPI of LMO's)), setting up the process for drafting rules and procedure on liability and redress, and addressing capacity building and the Biosafety Clearing House (BCH)¹¹.

The establishment of a Compliance Committee was seen to be a major achievement towards the Protocol's implementation. Notwithstanding its crucial importance, other outcomes of the meeting, such as the establishment of a Working Group mandated with drafting within 4 years, rules and procedures in the field of liability and redress should not be undervalued. "These are all solid steps towards the development of an operational and effective mechanism, which would simultaneously enable the Protocol's implementation, gain the confidence of Parties and non-Parties alike, and address society's concerns over potential risks of LMOs¹²."

The NGOs and Biodiversity:

When talking about biodiversity, one ought not to disregard the role played by non-governmental organization (NGOs) in advocating conservation and protection policies and in pinpointing to lacks and shortfalls that currently exist in international legal mechanisms such as the Convention on Biological Diversity and the Cartagena Protocol of Biosafety.

Indeed, organizations such as **Friends of the Earth, Greenpeace, WWF and ETC Group,** to name a few, act as pressure tools on both the public and private sectors to ensure a safe and transparent implementation of the existing treaties and to safeguard the rights of those who are most likely to be affected.

On the issue of Living Modified Organisms (LMOs) and Genetically Modified Crops (GMOs):

Given that the commercialization of GM crops had been a failure for biotech corporations between 1994 (when the first GM crop was commercialized in the US) and 2004, and since the promises made by biotech companies have not been fulfilled, opposition to GMOs is growing stronger by the day according to a report conducted by **Friends of the Earth International**.

Indeed, NGOs such as **Friends of the Earth**, **ETC group** and **GM Watch** have come to the following conclusions about GM crops:

- GMOs have been introduced without adequate understanding of their environmental, health and socioeconomic impacts. Cases of contamination have been registered between modified and non modified crops particularly through pollen transfer (according to a report by the European Environmental Agency¹³)
- GM crops are increasing corporate control over agriculture. The rights of farmers to save and use their own seeds, the foundation of agriculture, are under threat of being eliminated as a result of Terminator Seed Technology known as GURT. This Terminator technology refers to plants, which have been genetically modified in a way that renders their seeds sterile. The main reason behind the development of this technology by the multinational seed/agrochemical industry lies in preventing farmers from reusing their harvested seed, and to maximize seed industry profits. And while a majority of the world's farmers, primarily poor farmers in the developing world, depend on farm-saved seed as their primary seed source, the commercialization of GURT will not only force dependence on external seed sources but also extinguish the age-old practice of farmer selection and breeding 14.
- Nations should have the rights to impose bans on GM food, feed or commercial growing.
- GM food is unfit to feed the world. Biotech companies claim that that GM food is needed to feed the world in order to convince the public of its necessity. This however has been discredited by an increasing number of development and farmers' organizations, scientists and developing agricultural countries.
- There is an urgent need for an international liability regime. Existing liability regimes are insufficient. Biotech companies must pay for genetic contamination caused by LMOs in the environment.

¹³ Friends of the Earth International Report "Genetically Modified Crops: A decade of Failure [1994-2004] p.12

• *GM crops conflict with sustainable agriculture and food security.* Thus they encourage dependence on pesticides, which is hazardous to the environment and endangers food security¹⁵.

In February 27 2004, the **Institute for Agriculture and Trade Policy** of Minneapolis, praised the Parties to the Cartagena Protocol for reaching an agreement on identification and labeling of GMO exports. "...this represents a sharp rebuff to the Bush Administration's intensive behind-the-scene lobbying efforts to undermine the treaty through a coalition of the bribed and bullied¹⁶." According to the World Environment News agency **Planet Ark**, the Bush administration has often been criticized for lobbying almost exclusively on behalf of the biotech industry even if this came at the expense of many U.S farmers who are totally against further expansion of GE crops¹⁷.

One other impact of GM crops is related to its social and economic dimensions. Dr. Suman Sahai of **Gene Campaign and Consumers International, Asia-Pacific** has concluded, after attending the meeting on Biosafety Protocol in Kuala Lumpur, that while it is very important to monitor GM crops for their impact on biodiversity and the environment, as well as the health of humans and animals, "it is equally important to watch out for the social and economic consequences of this technology for farmers and consumers in developing countries¹⁸." Hence, if GM technology were to replace small farmers the impact would be rather negative than positive. One example is the recent attempt by western industries to produce the characteristics of coconut and palm oil in the more common canola (a form of mustard). And whereas many farmers in Asia earn their livelihood by exporting coconut and palm oil, the creation of the canola plant would entail the loss of market for these farmers. This justifies the need to regulate this issue under the already existing legal and international mechanisms such as the Cartagena Protocol.

On the issue of Technology Transfer (TT):

The transfer of technology or technology transfer (TT) is seen by some as the benevolent transfer of so called modern technology by industrial nations and their corporations to poorer countries. The aim lies in modernizing economies and transforming the way products are produced so countries become more efficient and productive within the global market system. The technology to be transferred is said to not only benefit large scale production, but also to assist small producers and manufacturers of goods, be they in the agricultural sector or otherwise.

However, according to Chee Yok Ling from **Third World Network**, Hope Shand from the **ETC Group** and Isabella Masindi from the **Intermediate Technology Development Group (ITDG Africa)**, technology transfer often poses a larger threat to the welfare of their recipient rather than a solution to their problems. New tools don't always deserve the name of being technology, because a technology is only useful if it is suitable to a community as a whole and not only parts of it. The technologies that are transferred in

18 Gene Campaign Press Release at www.genecampaign.org

the name of sustainability are often more destructive than beneficial. Yet within the CBD text on TT, governments are asked to promote to promote technology absorption.

The most dominant model of technology transfer today relates to what we have discussed in the previous paragraph mainly biotechnology. Hence, in the name of sustainability, corporations proudly announce that one third of the 68 million ha. of genetically modified crops is grown in the developing world in 11 countries. Yet the crops, according to **Third World Network**, **ETC Group** and **ITDG** "are the most inappropriate technology for the development and sustainability of communities. It is a technology that is highly productive, controlled by a handful of corporations, threatens local agricultural biodiversity and ecosystems, destroys farmers' knowledge and traditions, and makes seed saving a crime because of the conditions attached to the purchase of genetically modified seeds¹⁹." In this context, it is to be noted that corporations are monitoring farmers, and as witnessed in North America, have begun to take people to court for alleged misuse of their seeds. This greatly contributes to the farmer's loss of rights in terms of developing his crop diversity and being able to maintain a sound relationship with the land.

During COP7 meeting in Kula Lumpur, the technology transfer text has been largely criticized by NGOs, particularly the section related to the creation of "enabling environments" for technology transfer. This section is controversial because of its imbalance against developing countries. In this sense it lays the burden of creating an "enabling environment" on the South instead of facilitating the transfer in a matter that meets the South's needs and the Convention's objectives²⁰.

On the issue of Access and Benefit Sharing (ABS) and Biopiracy:

Since 1994, the Convention on Biological Diversity (CBD) has been promising "benefit sharing" to indigenous peoples in return for access to biodiversity (for example collecting samples for pharmaceutical production.) During these ten years, a coalition of indigenous people and farming communities from different parts of the world has worked long and hard to realize this goal. Governments' response has come in the form of the so-called Bonn Guidelines. And while these rules have been adopted after several years of negotiations at the VI Conference of the Parties of the CBD in The Hague in April 2002, they remain a subject of controversy and are criticized by many NGOs and members of Indigenous Communities.

Merle Alexander from the **Indigenous Peoples Forum** has criticized the Bonn Guidelines not only because they are not legally binding but also and more particularly because through these procedures the CBD awards sovereignty to the state and offers no legal rights to people and communities. In this sense these guidelines assume ABS can be achieved through contracts. But the net effect is to encourage biopiracy and discourage customary forms of knowledge. "ABS is not only an issue about patents, trade and the environment but also about human rights [...] in a country where indigenous peoples have very little rights, an international regime focusing on access can be used by a government to forcefully take traditional knowledge from them. ABS is

¹⁹ "Transferring Technology: To the Benefit of Whom?" Biotech IMC at www.biotechmic.org/or/2004/02

²⁰ "Technology Transfer: Removing Bias and Restoring Balance to the "Enabling Environment", ECO Vol.10, Issue 7, February 17, 2004 at www.itdg.org

basically an agreement between countries, but it does not guarantee that those indigenous peoples that develop, sustain and manage biodiversity will benefit from it²¹."

Hartmut Meyer, from the **NGO Forum Umwelt und Entwicklung** made his point by showing a clip from the film Pirates of the Caribbean and by pointing out that access is going on anyway, whether there is an international regime or not²².

In the eyes of activist non-governmental organizations such as ETC Group and Friends of the Earth International (FoEI), the Bonn Guidelines facilitate rather than hinder mainstream biopiracy, which is basically defined as "the privatization of genetic resources (including those derived from plants, animals, microorganisms, and humans) from those peoples who hold, maintain, embody, develop, breed or otherwise create, foster or nurture those resources. The biopirates' most frequent *modus operandi* is intellectual property (e.g., trademarks, patents, Plant Breeders Rights), asserted to gain monopoly control over genetic resources that were formally in the control of farmers and Indigenous Peoples and traditional communities. The resulting privatization of biological resources and related knowledge through intellectual property regimes is biopiracy, even though this process may be legal according to national law and though it may conform to a signed "bioprospecting agreement", and even if it includes a so-called "benefit sharing" agreement ²³." Thus, if a resource is privatized through the patent system, it is likely that a community that once had access to the resource will no longer have the legal right to use it or may no longer be able to afford to buy it.

In short, an international regime based on the Bonn Guidelines runs counter to sustainability since these rules according to **FoEI** contribute indirectly to the misappropriation of biological diversity and associated traditional knowledge by granting members of the indigenous community a consultative status only and surrendering the authority to the state for any final decision and also through the facilitation of patents and international property rights.

Consequently both **ETC** and **FoEI** have issued some recommendations and suggestions regarding the subject:

- As far as ETC is concerned, COP7 should provide an opportunity for the reformulation of the Bonn Guidelines. Moreover, a public international fund (a Global Biodiversity Fund) should be established through compulsory "taxes" paid by benefiting governments. The fund should be managed by the United Nations but it should also directly involve biodiversity actors. The fund's explicit purpose should be to sustain cultural and natural biodiversity, with monies made directly available to Indigenous Peoples organizations, small farmers' organizations and the like²⁴.
- **FoEI** has renewed its commitment to continue fighting against:
 - 1. "any new international regime that legitimizes biopiracy, patents on life and associated knowledge, and the privatization and commercialization of cultural and biological diversity,

- 2. against patents and other intellectual property rights and technologies that privatize biodiversity:
- **3.** for community management and control over biodiversity;
- 4. for the construction and conceptualization of collective rights by local communities and Indigenous Peoples, whether or not such rights are recognized by States;
- **5.** for environmental justice for all;
- 6. for the recognition and repayment of the ecological debt that has been accumulated by centuries of biopiracy and other predatory practices²⁵."

On the issue of Protected Areas (PA), particularly with regard to Forest and Marine life:

NGOs such as Greenpeace and WWF have consistently highlighted the plight of the world's last remaining ancient forests and the depletion of the oceans. During the UN meeting of the Convention for Biological Diversity in Kula Lumpur Malaysia, both Greenpeace and WWF urged governments around the world to protect life in all its diversity, indigenous peoples' rights and cultural variety by providing money for protection of life on land and sea. States must also ban large-scale industrial activity in all sensitive areas and establish a network of land and marine protected areas with effective law enforcement and management.

In the weeks leading up to COP7, **Greenpeace** has highlighted illegal logging operations in Asia Pacific, the bycatch and potential extinction of dolphins in the North Atlantic and plans to destroy the Patagonian forests in Chile. Indeed, Patagonia constitutes a typical example of an ancient forest under threat from development, as Canadian company Noranda plans to flood 10 000 ha of forest in order to build dams and highly polluting aluminum smelter known as Alumsva. With the aim of stopping the project, Greenpeace has purchased land in the area to be flooded. This land has been demarcated and is now officially a protected area²⁶.

Alongside Greenpeace and WWF, Kids for Forests is an ONG committed to the promotion of protected areas in every country and throughout the world. "Protected areas are the backbone of conserving life on earth [...] and even though the CBD commits each nation to establish such a system, this goal has not been yet met: the system of protected areas is not comprehensive, it does not represent enough of nature's biological diversity and it is not big enough²⁷."

Kids for Forests has actively participated in COP, calling on governments to adopt a strong program of work on protected areas with strict targets, specific timelines and clearly identified responsibilities. "We want them to tell us who (which country, which political institution) is doing what, by when and how they plan to establish a global network of protected areas²⁸."

28 Ibid

²⁵ "No to the Privatization and Commercialization of Life: Kuala Lumpur Malaysia 7th meeting of the Conference of the Parties (COP-7) at www.foei.org/cbd/index

[&]quot;World governments must stop destruction of forest and marine life" a report by Greenpeace at www.greenpeace.org/international_en/press/release
27 "Kids for Forest in action" at www.greenpeace.org/international_eng/press/release

Protected areas not only include forests but also marine and coastal environments. And despite being historically undervalued in the World Conservation investment portfolio since less than 0.5 % of the world's oceans are protected, communities and nations around the world are showing everyday their will to protect marine biodiversity, to restore depleted fisheries, and to conserve a precious resource for human communities for generations to come²⁹. Indeed a group of fishworker organizations (including World Forum of fisher People's, National fishworkers' Forum- India. Tambuvoq Development Centre- The Philippines, JALA- Indonesia, Penang Inshore Fishermen Welfare Association-Malaysia, Masifundise Organization-South Africa, CeDePesca- Argentina, Yadfon Association- Thailand, Sustainable Development Foundation- Thailand, Southern Fisherwork Federation Thailand, Instituto Terramar- Brazil, National Fisheries Solidarity- Sri Lanka, Bikis Lakas Philipinas- The Philippines, International Collective in Support of Fishworkers (ICSF), Kalapvriksh- India, and Forest People Program- United **Kingdom)** have urged the COP7 to include in its work agenda a call to recognize. protect and strengthen the rights of coastal and marine biodiversity in a responsible manner, to pursue sustainable livelihoods, and to participate in decision-making and resource management processes at all levels. Their statement also noted that there are over "200 million people worldwide who depend on inland and marine fisheries and fish farming for a livelihood. Most of them are in the artisanal and small-scale sector in the tropical multi-species fisheries of the developing world, and are among the poorest and most vulnerable sections of society³⁰." Thus, supporting and protecting sustainable livelihoods in the artisanal and small-scale fisheries sector would help achieve international commitments on poverty alleviation outlined in the Millennium Development goals.

COP7 was also pressured by NGOs such as **WWWF**, the National Resource Defense Council (NRDC) and the World Conservation Union (IUCN) to facilitate the creation of a global representative network of high seas marine protected areas consistent with international law and based on scientific information, and to ensure its effective management and enforcement. They also called on the UN General Assembly to work on protecting cold-water corals and other biodiversity hotspots from high seas bottom trawling until effective international management measures for bottom trawl fisheries in these areas are adopted³¹.

However, and despite global calls advocating the promotion of protected areas, the issue remains a controversial one since government designated PA have often harmed indigenous and local communities, and ignored their essential contribution to conservation according to a statement issued by over 3000 PA professionals, indigenous peoples and local communities at the 5th World Parks Congress. "Indigenous and local communities have been conserving and sustainably managing ecosystems and species for millennia, and in many parts of the world continue to do so... such "community conserved areas" need to be given equal recognition and support, within an overall framework in which diverse forms of governance of PAs are recognized and supported³²."

In sum several NGOs that gathered in COP7 called for a strong program of work (POW) on protected areas since they constitute the most effective way to reduce biodiversity

³² "Protected Areas: What is missing?" by Ashish Kotari in ECO Volume 10, Issue No.2 February 10, 2004

loss. "We urge our governments to commit to enhance and expand the network of protected areas on land and in our oceans including on the high seas. Protected areas themselves must adhere to standards of governance and performance relating to conservation effectiveness, social equity and cultural sustainability. We call on governments to ensure that protected areas do not alienate the rights of indigenous peoples and other local communities from their territories, resources and traditional life style and ensure they are not displaced or resettled when protected areas are established. Where this has occurred participatory mechanisms for restitution must be implemented. Areas conserved by communities should also be recognized as protected areas³³."

Conclusion:

Throughout history, the peoples of the world have understood that nature would be shared and not distributed. All human beings are thus bound to care for her and nourish her in order to guarantee the life of future generations. And because biodiversity is the collective product of the combined creative forces of the planet and of the native peoples of the whole world, the loss of it ultimately results in the loss of humanity.

Thus a turning point is upon us. We can continue to simplify the environment to meet immediate needs at the cost of long-term benefits or we can conserve life's precious diversity and use it sustainably. And if our goal is to ensure global economic and social development and guarantee a world rich in possibilities, then biodiversity protection constitutes one way to achieve it.

ANNEX 2

THE KUALA LUMPUR DECLARATION ON BIOLOGICAL DIVERSITY

The Kuala Lumpur Ministerial Declaration was adopted by acclamation at the conclusion of the high-level Ministerial Segment (18-19 February, 2004) of the Seventh Conference of Parties of the Convention on Biological Diversity.

We, the Ministers responsible for the implementation of the Convention on Biological Diversity and of the Cartagena Protocol on Biosafety having met in Kuala Lumpur on the occasion of the Seventh Meeting of the Conference of Parties to the Convention on Biological Diversity and of the First Meeting of the Parties to the Protocol;

Alarmed that biological diversity is being lost at an unprecedented rate as a result of human activities;

Recognising the objectives of the Convention pose enormous challenges to conventional approaches and that new solutions that recognize the interlinked nature of the issues and the three objectives of the Convention are needed to overcome many of these challenges;

Reconfirm our commitment to more effectively and coherently implement the three objectives of the Convention and achieve by 2010 a significant reduction of the current rate of biodiversity loss;

Welcoming the entry into force of the Cartagena Protocol on Biosafety; Urge Governments which have not done so, to ratify and implement the Convention on Biological Diversity and the Cartagena Protocol on Biosafety;

Reaffirming the significant role of indigenous and local communities in the conservation and sustainable use of biological resources;

Commit ourselves in a decisive manner to the development of an effective international regime on Access and Benefit Sharing and support relevant capacity building efforts;

Commit our Governments to integrate biodiversity conservation and sustainable use of its components into socio - economic development:

Commit our Governments to the establishment of networks of protected areas both marine and terrestrial and to the development of indicators and incentives to meet the 2010 target to reduce biodiversity loss;

Urge our Governments to take an effective role in the review of the Millennium Ecosystem Assessment during 2004 and establish a mechanism for continuing scientific assessment input into the Convention on Biological Diversity;

Create and strengthen partnerships at all levels with public and private partners to promote protected areas, equitable sharing of benefits, capacity building, the transfer of environmentally sound technology and the provision of adequate new and additional financial resources:

Urge our Governments to support the development of national and regional centres of excellence to assist developing countries and countries with economies in transition to exchange experiences;

Urge our Governments to identify and remove barriers to the exchange of key technologies for the implementation of the Convention.

ANNEX 3

NGO Statement on the Convention on Biological Diversity NGOs at the CBD. 19.02.2004 03:41

NGO STATEMENT FOR THE MINISTERIAL SEGMENT
Presented by the Malaysian Environmental NGOs (MENGO) coalition

With the continuing and alarming rate of biodiversity loss, life on earth is under threat and time is running out for the human race. Scientists have warned us of the devastating impact of climate on biodiversity loss, and of the adverse health impacts of both biodiversity loss and climate change. If we are to avert catastrophe and significantly reduce the current rate of biodiversity loss by 2010, all governments must act with urgency to reduce, even eliminate, the **threats** to biodiversity loss and implement the precautionary principle.

The rights of indigenous peoples, small farmers, fisherfolk and other local communities must be explicitly protected, and cultural diversity be fully recognized in biodiversity conservation and sustainable use of biological resources. We thus fully support the International Indigenous Forum on Biodiversity and Via Campesina (an international social movement of farmers) in their call for effective protection of their human rights. We pay tribute to the generations of communities that have developed technologies, conserved biodiversity and practiced sustainability in farming, fisheries and use of forests and water. Their knowledge and technologies are integral to the success of the CBD and, together with local and national NGOs, they also play an important role in monitoring the implementation of the CBD.

In reducing the threats to biodiversity, national governments and international organizations must take clear and determined actions to prohibit mining of minerals and water, oil exploration, commercial logging, and other harmful activities in and around protected areas. We are extremely concerned at the increasing privatization of protected areas, as well as the reduction of such areas through land conversion.

A strong work programme on **protected areas** is thus needed, and will only be effective if COP7 adopts clear targets and timelines and provides adequate financial support for developing countries. Protected areas are, in the short-term, the most effective way to reduce biodiversity loss and we urge our governments to commit to enhance and expand the network of protected areas on land and in our oceans including on the high seas. Protected areas themselves must adhere to standards of governance and performance relating to conservation effectiveness, social equity and cultural sustainability. We call on governments to ensure that protected areas **do** not alienate the rights of indigenous peoples and other local communities from their territories, resources and traditional lifestyle and ensure that they are not displaced or resettled when protected areas are established. Where this has occurred, participatory mechanisms for restitution must be implemented. Areas conserved by communities should also be recognized as protected areas.

Biodiversity hotspots of the deep sea are under severe threat from destructive fishing practices. The COP with the support of 1100 international scientists marine biologists

would also urge the United Nations General Assembly to declare a moratorium on bottom trawl fishing in these areas.

We call for concerted international action on **invasive alien species**, which was unanimously recognized at COP6 as a major threat to biodiversity. The ongoing challenge by Australia to the precautionary approach in the IAS Guiding Principles must not prevent or delay much needed international action.

To avoid more mistakes, we draw your attention to the CBD tourism guidelines that take a narrow and outdated approach to tourism development. They fail to reflect issues such as economic globalization, the widening gap between rich and poor countries, and cultural marginalization through tourism. They may even threaten protected areas and indigenous peoples territories by allowing unsustainable commercial tourism. We urge Ministers to ensure that these guidelines are fundamentally reviewed, with full participation of indigenous peoples and local communities. The guidelines should not be adopted here at COP7, and be referred to COP8 instead.

We also call on all governments to take strong and urgent steps to achieve sustainable production and consumption, and in particular to curb the rampant the over consumption of rich nations and people.

Any scientific assessment, policy or law formulation must adopt a holistic approach (ecological, socio-economic, cultural and ethical) and implement the precautionary principle. Thus the **technology transfer and cooperation** work programme must acknowledge 4 major obstacles that are the primary responsibility of developed countries: intellectual property rights (IPRs), especially patents on life forms; arbitrary export controls by developed countries; restrictive business practices by the private sector; and the lack of a holistic system for technology assessment. COP7 must not adopt a work programme that seeks to further liberalise the economies of developing countries, and protect corporate IPRs. COP7 should contribute instead to the development of international mechanisms, including agreements that ensure the development and sharing of technologies that are environmentally, socially and economically sustainable, consistent with the objectives of the CBD.

Technology, we emphasis, is ultimately only a tool. It can be powerful in causing harm to biodiversity, the environment and human health as we have seen from the experience of chemicals. We thus call on Ministers to ensure that technology development and transfer is based on the needs and priorities identified by countries, subject to participatory processes, assessment and adaptation to meet the objectives of the CBD. For an urgent start, this means a global ban on the GURTS or terminator technology, no technology dumping and the right to say No to genetically modified organisms (GMOs) by countries, indigenous peoples, small farmers, fisherfolk and other local communities. We also reject the inclusion of GMOs in food aid. We will work with our respective governments to establish comprehensive national laws and biosafety systems, and implement the Cartagena Protocol on Biosafety which sets minimum standards. We hope that non-Parties to the Protocol will not undermine the spirit and principles of the Protocol.

Biopiracy continues to be a major problem that undermines efforts to conserve biological diversity, protect traditional knowledge and ensure sustainable use. Biopiracy makes a mockery of the CBD objective of ensuring fair and equitable sharing of benefits among countries and within countries. Existing regulations and practices have failed to stop biopiracy. A strong international regime is thus urgently needed, but we reject

attempts to turn this into a facilitation of access. The mandate of Heads of States at the WSSD was to negotiate an international regime on benefit sharing. Piracy of natural resources and traditional knowledge is the problem, not the gaining of access. We therefore call for the following principles in any new regime on benefit sharing:

- The principle of inalienable collective rights and customary laws of indigenous peoples, small farmers and local communities to land, natural resources (including genetic resources) and traditional knowledge;
- The requirement of free and prior informed consent of indigenous peoples, local communities and countries of origin which should be specific for each particular use or user/broker. The right to deny access to genetic resources and traditional knowledge should be upheld;
- Genetic resources and traditional knowledge must be free of intellectual property rights, and CBD Parties should halt and reverse the patenting of life forms.

Adequate funding is needed work programmes adopted since 1993 and at COP7, and developed countries governments in particular must fulfill their commitments under the CBD. We also urge Ministers here to cooperate with other colleagues in your governments to ensure that trade and economic rules and practices respect the CBD objectives and human rights. In many cases, global trade is a driving force behind the unsustainable exploitation of biodiversity. We regret the efforts of some countries to consistently subordinate CBD discussions to trade rules. If the CBD is to maintain its integrity and independence these efforts must stop.
